Sales Strategy Forecast

Log-linear regression model to visualize the relative impact of promotions, seasonality, and product position on sales volume

Key Insights:

- Either promotions, seasonality, nor placement showed a significant impact on sales volume
- Peak performance is estimated to be 1,902 units when the product is placed at the **front of the store**, **without it being a promotional or seasonal item**.
- Alternatively, when running a **promotion for seasonal item**, it is best practice to display it **end-cap**, yielding second highest sales volume of 1,796 units.

Interaction Plots

Key Insights:

- End-cap is a high stakes location– **enhance promotional performance**, but worst performing for regular items
- **Seasonal momentum** can be maximized by **moving items to storefront display** and increasing their visibility
- **Promotions are highly effective for seasonal items** but devalue non-seasonal products
